TOPICS

Library Management System

1. Data Setup:

The `books` array holds book objects with properties like `id`, `name`, and `quantity`. We also initialize two arrays:

- `issuedBooksArray` to store issued books.
- `returnedBooksArray` to store books that are returned.

2. Display Books (`displayBooks` function):

This function displays the books in a table on the web page.

- It first clears the existing content in the table, then loops over each book in the books array (this is iteration).
- For each book, it creates a row and adds the book's id, name, and quantity into that row.
- This function is updating the display each time it's called.

Thank you
